

INTEGRATED PROJECT OFFICE

Suresh Madhavan

ABSTRACT

5 A method for representing a project over a network includes a server computer
receiving a list of requirements for the project from a first client computer connected to
the network. In response, the server computer transmits the list of requirements to a
second client computer connected to the network. The server computer later receives a
list of responses to the requirements from the second client computer. The server
computer further receives at one or more links between the list of responses and the list of
10 requirements from the second computer.
